Health & Nutrition Programs

Question

Does the company have programs on health & nutrition?

Rationale

Addressing consumer health and nutrition concerns requires more than just information transparency, it demands proactive initiatives and structured programs. Companies must develop and implement comprehensive health and nutrition programs that go beyond risk mitigation and focus on promoting the well-being of consumers, particularly those in priority populations who are most vulnerable to nutrition-related issues.

By embedding health and nutrition programs into their core strategies, companies can more effectively respond to consumer needs and contribute to societal well-being. This includes identifying specific nutritional challenges, setting concrete reformulation targets to improve product health profiles, and leveraging recognized nutritional profiling systems. The emphasis should be on continuous improvement and innovation in product offerings to better support balanced diets and healthier lifestyles.

Evaluating these programs provides insights into how well a company integrates health and nutrition considerations into its product development, ensuring it not only addresses nutritional risks but also actively contributes to healthier food environments.

Performance Summary

Question Level Company Performance	100
Question Weight	34
Year-on-Year Change	0
Industry Average Score	14
Industry Highest Score	100

The question layout and the company's verified information is provided below. No information is shown if the company did not provide any information or if it opted out of sharing non-public information.

Key Definitions

Nutrition Profiling System (NPS): Structured frameworks or methodologies used to evaluate and classify the nutritional quality of foods and beverages. These systems assess products based on factors such as nutrient content, ingredient composition, and health impacts. The goal is to provide a clear, standardized way to compare products, support healthier choices, and guide product reformulation by highlighting aspects like levels of sugar, salt, fats, and essential nutrients.

External benchmarks: Standardized criteria or reference points established by independent organizations, regulatory bodies, or scientific authorities to evaluate the nutritional quality of food and beverages. These benchmarks provide objective standards, such as nutrient thresholds or dietary guidelines, that companies can use to align their products with recognized health and nutrition goals, ensuring consistency and credibility in their nutritional assessments.

Quantified targets to reduce levels of fat, salt, sugars, or additives: Targets to decreasing the content of specific unhealthy components in food and beverages, including saturated fats, trans fats, sodium, added sugars, calories, artificial sweeteners, colors, and preservatives. These targets involve measurable reductions to enhance the nutritional profile of products and support healthier consumption patterns.

Quantified targets for fortified foods with increased nutritious ingredients: Targets to enrich food products with beneficial nutrients such as dietary fiber, vitamins, minerals, phytochemicals, or other functional food additives. These targets focus on incorporating ingredients like fruits, vegetables, nuts, legumes, and whole grains to boost the nutritional value and support improved health outcomes for consumers.

Quantified nutrition targets: Objectives with specific, measurable, and quantifiable Health & Nutrition performance improvement targets (e.g., reduce sodium content in products by 15% by 2030, 85% of the portfolio scoring 3.5 stars or above by 2025). These targets should be time-bound and include a target year.

Reporting on target progress: Quantifiable progress towards nutrition targets is to be reported at least for the current financial year.

Priority populations: Refer to groups that are disproportionately affected by malnutrition, diet-related health conditions, or limited access to nutritious foods. These populations often include infants and young children, pregnant and lactating women, low-income communities, and individuals with chronic health issues. Tailoring interventions to meet the distinct nutritional needs of these populations is essential for promoting health equity and reducing the burden of diet-related diseases.

Portion-control packaging design: Packaging development for consumer portion control refers to the design and innovation of product packaging that supports consumers in making healthier eating choices by regulating the amount of food consumed per serving. This involves features such as single-serving packs, resealable packaging to encourage mindful consumption, visual markers for portion guidance, and clear labelling that highlights recommended serving sizes, ultimately helping to reduce overconsumption and promote balanced eating habits.

R&D investment to improve nutrition: Refers to research and development activities aimed at enhancing the overall nutritional profile of food products. The goal is to create or modify food items so that they provide better health benefits, improving the intake of essential nutrients such as vitamins, minerals, proteins, and healthy fats. These R&D efforts may include developing new formulations, reducing unhealthy components (e.g., sugar, sodium, or unhealthy fats), increasing the presence of bioavailable nutrients, and ensuring that products cater to a broader spectrum of dietary needs. By improving the nutritional quality of foods, these innovations can contribute to better public health outcomes and support healthier eating habits on a global scale.

R&D investment to improve affordability or accessibility of healthy products: This metric focuses on research and development efforts aimed at enhancing or modifying products to meet the needs of specific populations, particularly those with limited resources, rather than simply creating new products. The goal is to make nutritious products more affordable and accessible. Examples of relevant research include:

- Developing gentler processing methods that preserve the nutritional quality of processed foods.
- Addressing and improving (micro)nutrient deficiencies and increasing nutrient bioavailability.
- Innovating new approaches for (bio)fortification to enhance nutrient content.
- Enhancing refrigerated or other forms of packaging and distribution systems in low-resource areas to extend the shelf life of fortified foods.

Data Requirements

Not Applicable: All request to mark "Not applicable" must be supported with an explanation in the additional comment textbox.

- Agricultural Products (incl. meat, poultry, dairy, etc.): Not applicable can be accepted only if the company does not generate more than 10% of its revenue from processed food & beverage products.
- Alcoholic beverage: Not applicable can be accepted if the company generates more than 90% of its revenue from alcoholic beverages.
- Drug Retailers: Not applicable can be accepted if the company generates more than 90% of its revenue from drug retailing only.

Disclosure Requirements

The information provided must be in your public reporting (e.g., strategy or risk section of an annual report, sustainability report, integrated report, company publications), or in a dedicated section (e.g., Health & Nutrition section) of your corporate website.

If a company selects that yes, they have programs in place but does not select any of the subsequent options, then the answer will not be accepted.

Data View

QUESTION LEVEL INPUT	COMPANY ANSWER
The programs covers use of a nutritional profiling system	YES
The programs covers health & nutrition criteria that align with external benchmarks	YES
The programs covers quantified targets to reduce levels of fat, salt, sugars, or additives	YES
The programs covers quantified targets for fortified foods with increased nutritious ingredients	YES
The programs covers reporting on progress of Health & Nutrition targets	YES
The programs covers products specifically aimed at priority populations	YES
The programs covers portion-control packaging design	YES
The programs covers R&D investment to improve nutrition	YES
The company has Health & Nutrition program(s). (2025)	Applicable

Grupo Bimbo, S.A.B. de C.V. | ESG Scores Raw Data

QUESTION LEVEL INPUT	COMPANY ANSWER
The programs covers R&D investment to improve affordability or accessibility of healthy products (2025)	YES

Questionnaire

Does the company have Health & Nutrition programs in place?

1. (●)

   Yes, the company has Health & Nutrition programs that cover the following elements. Please indicate where this information is available in **public reporting or corporate website.**

   1. ☑ Use of a nutritional profiling system
   2. ☑ Health & nutrition criteria that align with external benchmarks
   3. ☑ Quantified targets to reduce levels of fat, salt, sugars, or additives
   4. ☑ Quantified targets for fortified foods with increased nutritious ingredients
   5. ☑ Reporting on progress of Health & Nutrition targets
   6. ☑ Products specifically aimed at priority populations
   7. ☑ Portion-control packaging design
   8. ☑ R&D investment to improve nutrition
   9. ☑ R&D investment to improve affordability or accessibility of healthy products

2. ( ) No, the company does not publicly report on programs for Health & Nutrition.
3. ( ) Not applicable. Please provide explanations in the comment box below.

Confidential additional comments

Use the text field below only in the following cases: (i) to describe significant changes in data or calculation methodology compared to last year's submission, (ii) to explain why a question is not applicable to your company's business model, (iii) to explain if your data deviates from the unit or format requested, or (iv) to provide supporting notes on translations of non-English references.
