Question: Energy Consumption
Include Modeled Scores : Yes

Energy Consumption

Question

Does the company track its energy consumption?

Rationale

In the last century, there has been an unprecedented increase in the use of natural resources and materials. Producing more with fewer material is essential for many industries affected by the increasing scarcity of natural resources. Resource efficiency and circularity can enhance companies' competitiveness through reduced costs and environmental liabilities. It can also prepare companies for future environmental regulations. In this question, we will review total non-renewable and renewable energy consumption, assessing the overall trend of consumption, as well as the target set for the current financial year.

Performance Summary	
Question Level Company Performance	100
Question Weight	50
Year-on-Year Change	0
Industry Average Score	38
Industry Highest Score	100

The question layout and the company's verified information is provided below. No information is shown if the company did not provide any information or if it opted out of sharing non-public information.

Additional Question Guidance & Information Display

Key Definitions

Total non-renewable energy consumption: This is the sum of the non-renewable consumption of fuel (excluding feedstocks), the consumption of non-renewable purchased or acquired electricity, and the consumption of non-renewable purchased or acquired heat, steam and cooling.

Total renewable energy consumption: This is the sum of the consumption of renewable fuel (excluding feedstocks), the consumption of renewable purchased or acquired electricity, the consumption of renewable purchased or acquired heat, steam and cooling, and the consumption of self-generated non-fuel renewable energy.

Renewable energy: This is energy taken from sources that are inexhaustible, such as wind, solar, hydropower, geothermal, biomass and marine (tidal and wave energy), as defined by the GHG Protocol. Please note that hydrogen should not be included if it is derived from fossil fuels. Similarly, waste energy should not be included if it is derived from fossil fuels.

Non-renewable energy: This is the energy from sources such as coal, oil and natural gas, that is not derived from renewable sources. Please note that blended fuels from both renewable and non-renewable sources should be split by the proportion contained from each source. Nuclear energy is not considered as renewable and should be reported under total non-renewable energy. Please note that direct consumption of nuclear fuel should not be included. Fuels, excluding nuclear, should be covered, including fleet fuel. The consumption of purchased or acquired electricity, steam heat, and/or cooling from nuclear sources should be included.

Self-generated non-fuel renewable energy: If your organization produces renewable energy that is not based on fuel, such as solar, wind, hydro, geothermal or marine, any consumption of this energy should be entered under total renewable energy. All forms of non-fuel renewable energy, electricity, heat, steam or cooling should be included under total renewable energy.

Excluding feedstocks: Fuels consumed as feedstocks are those that are not combusted for energy purposes. All fuel consumed for energy purposes inside the organizational boundary should be included, regardless of whether the fuel was purchased or produced by the organization. If a fuel is consumed as a feedstock to produce another fuel, then the feedstock should not be included, but the combustion of the produced fuel should be included. Ultimately, if a fuel is combusted, i.e., consumed for energy purposes and not as a feedstock, then it should be included. For example, naphtha and ethane are feedstocks that may be converted into petrochemical products such as ethylene, and should not be included. The steel industry is a special case because coke and fuel injectants consumed at the blast furnace serve as feedstocks and an energy source. These fuels, such as coke being used as a reducing agent, are considered feedstocks and should not be counted. However, all fuels consumed or combusted for energy that are derived from fuel feedstocks such as blast furnace gas should be counted.

This table is for gross energy consumption data only. You should not provide net consumption nor deduct for energy produced or exported from the organizational boundary. Because feedstock fuels are excluded from this question, this approach should not lead to double counting. Companies shall use the total, or gross, electricity purchases from the grid rather than grid purchases net of generation for the Scope 2 calculation. A company's total energy consumption would therefore include self-generated energy (any emissions reflected in Scope 1) and total electricity purchased from the grid. This excludes generation sold back to the grid.

Purchased or acquired electricity, steam, heat, cooling:

- This includes the consumed electricity, heat, steam, and/or cooling that was purchased or acquired, i.e., brought into the organizational boundary. This excludes the consumption of electricity, heat, steam or cooling that was produced by the organization or inside the organizational boundary. It also excludes purchased or acquired electricity, heat, steam or cooling that is not consumed inside the organizational boundary. Purchased or acquired electricity, heat, steam or cooling that is wasted should still be counted as consumption.
- Purchased or acquired electricity, steam, heat, and cooling are aligned with the boundary for Scope 2 emissions. The consumption of fuel, excluding feedstocks, should be entered if the fuel was consumed inside your organizational boundary in the last fiscal year and is aligned with the boundary for Scope 1 emissions. Therefore, in this question, we would like to assess your energy consumption for Scope 1 and Scope 2.
- Specific information on these energy carriers can be found in Section 5.3.1 and Appendix A of the GHG Protocol Scope 2 Guidance.
- The terms "purchased" and "acquired" are used when your organization has received the energy from a third party. This rules out energy that is sourced from within the organizational boundary. It should be noted that purchased or acquired heat does not include the heat content, or calorific value, of fuels that are purchased or acquired by the organization. This is accounted for at the point of fuel consumption, which falls inside the Scope 1 boundary. You should also be aware that steam, heat or cooling received directly as "waste" from a third party's industrial processes should still be accounted for if it is consumed.
- If your organization produces renewable energy that is not based on fuel, such as solar, wind, hydro, geothermal or marine, this energy consumption should be included in the total renewable energy consumption. The consumption of renewable fuels, such as solid and liquid biofuels and biogas, should also be included. All forms of nonfuel renewable energy, such as electricity, heat, steam or cooling, should be included under non-renewable energy.

Leased assets: Guidance for how to handle leased assets and spaces can be found on page 36 of the GHG Scope 2 Protocol, (5.2.1).

Renewable energy credits (RECs): These should be represented in megawatt-hours under renewable sources. RECs, RECs from power purchase agreements, energy attribute certificates, contractual instruments, tradable instruments for global renewables and unbundled certificates should be represented in megawatt-hours under renewable sources.

Units and conversion:

- The most common unit for electricity is the watt-hour. 1 million Wh equals to 1 MWh, or 1,000 kWh.
- If your raw data is in energy units other than megawatt-hours, such as gigajoules (GJ) or British thermal units, you should convert to your data to megawatt-hours. For example, since 1 GJ = 0.277778 MWh, if your data is in gigajoules, you should multiply your data by 0.277778. If your data is in millions of British thermal units, you need to multiply your data by 0.29307.
- Conversion factors from other energy units are available from a variety of online calculation tools, including from the International Energy Agency and OnlineConversion.com, or from conversion tables such as the Environmental Protection Agency's AP-42 (Appendix A).
- If your raw data is represented by units of volume such as cubic feet or gallons, or units of mass such as such as kilograms or pounds, you should convert it to units of energy using factors for fuel heating/calorific values. These are available from numerous sources, some of which are listed below:

Intergovernmental Panel on Climate Change Guidelines for National GHG Inventories (Volume 2, Table 1.2, p1.18-1.19)

EPA AP-42 (Annex A)

International Energy Agency Statistics Manual (Annex 3, p180-183)

American Petroleum Institute Compendium (Table 3-8, p3.20-3.21)

- If your raw data for steam is in physical units such as pounds or kilograms, you should convert it to units of energy. The energy content of steam varies with temperature and pressure. Organizations can refer to The Climate Registry's General Reporting Protocol, Chapter 15, section 15.2, step 1, which explains how to calculate the energy content of steam.
- Cooling is frequently purchased in refrigeration-ton hours; 1 ton-hour is equal to 12,000 Btu, or 0.003516 MWh.

Data Requirements

For each row in the table, it is mandatory that the values provided are in the same unit.

Please ensure that the "Company Information" section at the beginning of the questionnaire has been correctly filled, and that the coverage in the table is related to the denominator relevant for the company as indicated in that section.

Third-party Verification: For third-party verification, we expect that data in the most recent year reported has been third-party verified and that relevant documentation is attached showing this verification. Internal audits or verification will not be considered.

Please note: In case the company has reported a value of zero in the table, third-party verification or supporting evidence is required (e.g., comprehensive comment, internal documentation or public reporting) to substantiate the zero reported.

Please note: In cases where the company is classified within the **banks (BNK), financial services (FBN), insurance (INS) or professional services (PRO)** industries, the score obtained in this question will not contribute to the final score of the company.

Disclosure Requirements

For this question, we encourage you to provide evidence that is publicly available. Additional credit may be granted for publicly available evidence.

Disclosure Requirements for Partially Public Questions: Additional credit will be granted for relevant publicly available evidence covering the following aspect of this question:

- Total non-renewable energy consumption for at least the most recent reported year

Data View

QUESTION LEVEL INPUT	COMPANY ANSWER
Company reports on total energy consumption	Applicable
Total renewable energy (wind, solar, biomass, hydroelectric, geothermal, etc.) purchased or generated (D) (2022) (MWh)	1,258,210.000
Total renewable energy (wind, solar, biomass, hydroelectric, geothermal, etc.) purchased or generated (D) (2023) (MWh)	1,442,716.000
Total renewable energy (wind, solar, biomass, hydroelectric, geothermal, etc.) purchased or generated (D) (2024) (MWh)	1,461,424.000
Total renewable energy (wind, solar, biomass, hydroelectric, geothermal, etc.) purchased or generated (D) (2025) (MWh)	1,648,510.000
Total non-renewable energy consumption (2022) (MWh)	219,927.000
Total non-renewable energy consumption (2023) (MWh)	131,765.000
Total non-renewable energy consumption (2024) (MWh)	48,685.000
Total non-renewable energy consumption (2025) (MWh)	18,456.000
Target for total non-renewable energy consumption for last fiscal year reported (MWh)	Not answered
Energy: Data coverage (2022)	100
Energy: Data coverage (2023)	100
Energy: Data coverage (2024)	100
Energy: Data coverage (2025)	100
Public reporting: Energy consumption data is publicly available	YES
Third party verification: Non-renewable energy consumption data verified by third party for most recent fiscal year reported	YES
Data consistency: Non-renewable energy consumption data reported in the questionnaire differs from publicly available data	-
Data consistency: Temporary coverage reduction or target challenge in non-renewable energy consumption data due to corporate actions	-
Data consistency: Non-renewable energy consumption data is not reported in absolute terms and is normalized	-

Questionnaire

Does the company track its energy consumption?

1. (•)

   Yes, the company tracks its energy consumption. Please indicate where this information is available.

Energy consumption	Unit	FY 2022	FY 2023	FY 2024	FY 2025	Target for FY 2025
Total non-renewable energy consumption	MWh	219927	131765	48685	18456	Not answered
Total renewable energy consumption	MWh	1258210	1442716	1461424	1648510	
Coverage (as a percentage of denominator)	percentage of:	100	100	100	100	

   1. [x] The data is publicly available.
   2. [x] The data has been third-party verified.
   3. [ ] The data is normalized.
   4. [ ] The data differs from its publicly reported figures. Please provide an explanation:
   5. [ ] The coverage is temporarily reduced due to corporate actions. Please provide an explanation:

2. ( ) No, the company does not track its energy consumption.
3. ( ) The question is not applicable to the company.
4. ( ) The information is not available.
