Question: GMO Revenue
Include Modeled Scores : Yes

GMO Revenue

Question

What percentage of your company's consolidated revenues (excluding revenues of business units or product lines with no potential GMO exposure) in the past fiscal year were derived from GMO products or products that contain GMO ingredients (independent from the limit sets by individual country labeling regulations)?

Rationale

The purpose of the question is to assess the potential risk of companies revenue exposure towards GMOs. Considering the constantly evolving landscape around GMOs, companies are expected to be aware of their exposure to this risk. A high exposure to GMOs represents a potential risk profile of the company in case regulations are becoming stricter on GMOs or the sensitivity of the consumer towards GMO's changes. In this question, we assess the percentage of consolidated revenues derived from GMOs or products that contain GMO ingredients and use it as a proxy to assess the potential risk exposure of companies towards GMOs.

Performance Summary

Question Level Company Performance	42
Question Weight	30
Year-on-Year Change	1
Industry Average Score	13
Industry Highest Score	100

The question layout and the company's verified information is provided below. No information is shown if the company did not provide any information or if it opted out of sharing non-public information.

Key Definitions

Genetically Modified Organisms (GMOs): Organisms (i.e. plants, animals or microorganisms) in which the genetic material (DNA) has been altered in a way that does not occur naturally by mating and/or natural recombination. The technology is often called "modern biotechnology" or "gene technology", sometimes also "recombinant DNA technology" or "genetic engineering". It allows selected individual genes to be transferred from one organism into another, also between nonrelated species. (Source: WHO)

Examples are genetically modified seeds, crops (cotton, corn, soybean, wheat, rice), plants (papaya, potato, tomato, canola, sugar beets), fish (salmon) etc.

Non-GMO: Products which are not GMO, ingredients derived from GMO, products that contain GMOs or products containing ingredients derived from GMOs as defined above.

Ingredients derived from GMOs: Ingredients which are derived from organisms whose genetic materials (DNA) have been modified in a way that does not occur naturally. Examples are corn flour from genetically modified corn, and cottonseed oil from genetically modified cotton.

Products that contain GMOs or ingredients derived from GMOs: Products which contain either organisms whose genetic material (DNA) has been modified or ingredients which are derived from organisms whose genetic materials (DNA) have been modified in a way that does not occur naturally. Examples are foods produced from genetically modified corn or using ingredients from genetically modified corn, and animal feed produced from genetically modified soybean or using ingredients from genetically modified soybean.

Data Requirements

The scope of this question is any type of product that contains GM material greater than 0.9 percent, in line with EU GMO labelling requirements set out in Regulation (EC) No 1829/2003.

- Please note that this threshold is on product level: That means that we expect companies to check for all their products. If they have only a few or one product with GM material less than 0.9 percent then the company is considered as having no GMO exposure and they can mark "No, our company does not have any GMO exposure." in the GMO Exposure question.

Companies answering "No, our company does not have any GMO exposure" in the GMO Exposure question are still expected to answer the GMO Statement question and mark the GMO Revenues question as Not Applicable.

The following companies should mark this question as "Not Applicable" and provide a brief explanation in the comment box:

- BVG companies that only do bottling and do not source their own raw materials to produce their own products
- FDR companies that do not have private label (or own brand) products in retailing or distribution
- FDR companies classified under Drug Retail
- Commodities companies that only trade raw materials that cannot be genetically modified e.g. palm oil, rubber

The following companies that should not mark the question as "Not Applicable":

- BVG companies that produce their own products that contain GMOs or ingredients derived from GMOs
- FDR companies that have private label (or own brand) products that contain GMOs or ingredients derived from GMOs in retailing or distribution
- FOA companies that use animal feed with GMOs or ingredients derived from GMOs
- REX companies that use GMOs or ingredients derived from GMOs

Supporting evidence:
No document is required to support your response. You may still provide a reference using the reference clip. This could include examples of the underlying calculations or approaches to data aggregation used to compile the provided quantitative information.

Questionnaire

If your company produces GMOs or ingredients derived from GMOs, or products containing GMOs or products containing ingredients derived from GMOs, what percentage of the total consolidated revenue in the last fiscal year is from all products mentioned above? **Please note that the scope of this question is any type of product that contains GM material greater than 0.9 percent.**

The percentage should be calculated by subtracting the percentage of Non-GMO products (i.e. products which are not GMO, ingredients derived from GMOs or products that contain GMOs, products containing ingredients derived from GMOs) from total consolidated revenues. **Please note that revenues from products that cannot be identified as non-GMO should be counted as GMO revenues, assuming that these products may have potential exposure to GMOs.**

1. ○
   GMO Revenues = Total Revenues – Non-GMO Revenues =
