Information Security Policy

Question

Does the company have a policy on information security and is it available publicly?

Rationale

Due to the current trend of digitization, including but not limited to cloud computing, online market places and payments, etc., it is crucial that access to network, IT systems and data is assured at all times. As a result, lower than agreed upon system performance or service disruptions can result in higher costs and reputational risk for companies. The main risks stem from technical failure, human error, malicious attacks, weather events, natural disasters or terrorist attacks. Managing such risks, including contingency plans, is crucial to ensuring business continuity.

Over the past decade, the number of information security breaches has grown exponentially with some attacks reaching unprecedented scale and the cyber threat landscape continues to grow and evolve, abusing existing and new technologies and exploiting vulnerable users. These incidents and the related costs have shown that information security/cybersecurity has become a financially material issue which must be diligently managed to protect corporate value. The costs of cyberattack are manifold and can impact the company in different ways. Internal costs are operational costs and relate to dealing with cybercrime and incidence prevention. External costs include the consequences of the cyber-attack such as the loss or theft of sensitive information, operations' disruption, fines and penalties, infrastructure damage or revenue losses due to loss of customers. Thus, ensuring the security and resilience of netw

The question assesses what security measures are in place to ensure employees are aware of threat issues and the importance of information security/cybersecurity.

Additional Question Guidance & Information Display

Key Definitions

IT security: The process of implementing measures and systems designed to securely protect and safeguard information utilizing various forms of technology. IT security is thus considered a bit broader than cybersecurity.

Information System: Applications, services, information technology assets, or other information handling components (according to ISO).

Cybersecurity: Body of technologies, processes and practices designed to protect networks, systems, computers, programs and data from attack, damage or unauthorized access (according to SEC).

Information security: The protection of information and information systems from unauthorized access, use, disclosure, disruption, modification, or destruction in order to provide confidentiality, integrity, and availability (according to NIST).

Important note: Throughout the whole criterion we always refer to IT security, cybersecurity or information security according to the definitions above. For the appraisal of the criterion we will treat "IT security", "information security" and "cybersecurity" equally.

Data Requirements

Supporting evidence:

- The document(s) you attached will be used to verify your response.
- The supporting documents do not need to be available in the public domain.
- If a question text field is available, a comprehensive answer in that field can be accepted instead of a supporting document.
- Any response that cannot be verified in the attached document(s) or via the information provided in the related question text field (if available) will not be accepted.
